warehouse

internal infrastructure

Internal functionality made available as a service

[from ACKM04]

5

When Web Services Should Be Applied ?

When it is no possible to easily manage deployment so that all requesters and providers are upgraded at once
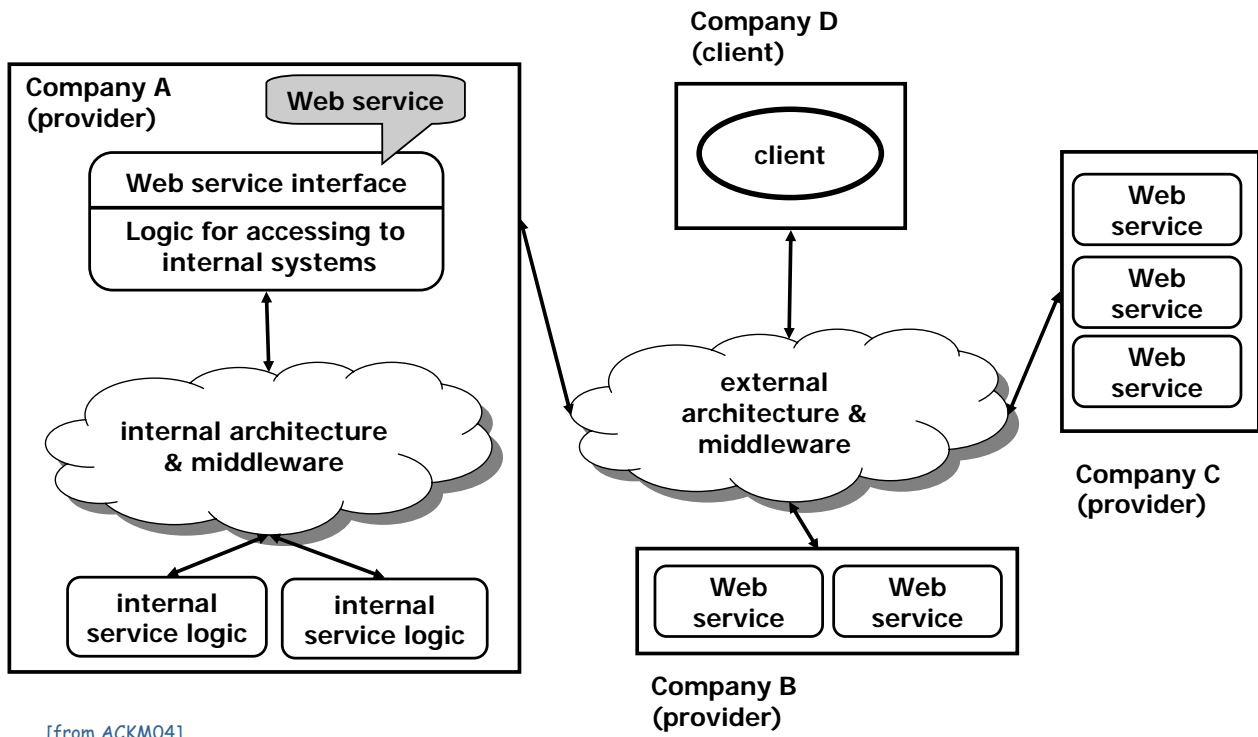

When components of the distributed system run on different platforms and vendor products

**When an existing application needs to be exposed over a network for use by unknown requesters**

Web Services Architecture,
*W3C Working Group Note, 11 Feb. 2004, http://www.w3.org/TR/ws-arch/*

  <types>
    <element name="ListOfSong_Type">
      <complexType><sequence>
        <element minOccurs="0" maxOccurs="unbound"
          name="SongTitle" type="xs:string"/>
      </sequence></complexType>
    </element>
    <element name="SearchByTitleRequest">
      <complexType><all>
        <element name="containedInTitle"
          type="xs:string"/>
      </all></complexType>
    </element>
    <element name="SearchByTitleResponse">
      <complexType><all>
        <element name="matchingSongs"
          xsi:type="ListOfSong_Type"/>
      </all></complexType>
    </element>
```

Definition of a message and its formal parameter

An Example (2)

```
<element name="SearchByAuthorRequest">
  <complexType><all>
    <element name="authorName"
      type="xs:string"/>
  </all></complexType>
</element>
<element name="SearchByAuthorResponse">
  <complexType><all>
    <element name="matchingSongs"
      xsi:type="ListOfSong_Type"/>
  </all></complexType>
</element>
<element name="ListenRequest">
  <complexType><all>
    <element name="selectedSong"
      type="xs:string"/>
  </all></complexType>
</element>
```

An Example (3)

```
<element name="ListenResponse">
    <complexType><all>
        <element name="MP3fileURL" type="xs:string"/>
    </all></complexType>
</element>
<element name="ErrorMessage">
    <complexType><all>
        <element name="cause" type="xs:string"/>
    </all></complexType>
</element>
</types>
```
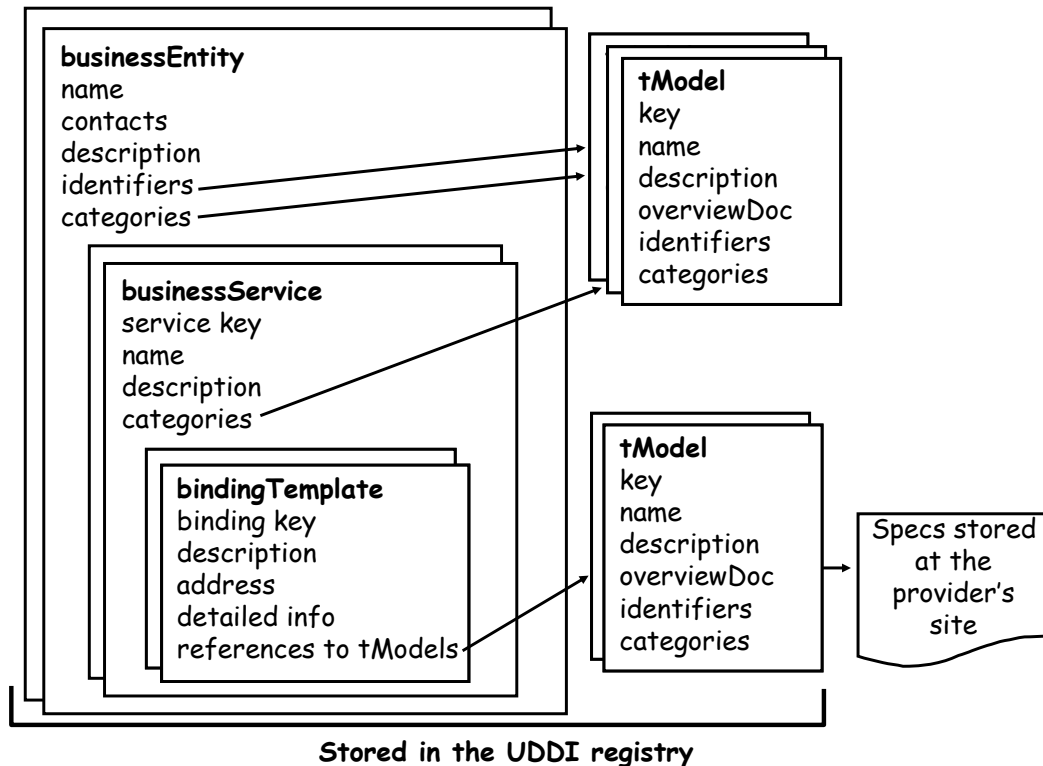

An Exa

Definition of a
service interface

```
<interface name="MP3ServiceType">
    <operation name="search_by_title" pattern="in-out">
        <input message="SearchByTitleRequest"/>
        <output message="SearchByTitleResponse"/>
        <outfault message="ErrorMessage"/>
    </operation>
    <operation name="search_by_author" pattern="in-out">
        <input message="SearchByAuthorRequest"/>
        <output message="SearchByAuthorResponse"/>
        <outfault message="ErrorMessage"/>
    </operation>
    <operation name="listen" pattern="in-out">
        <input message="ListenRequest"/>
        <output message="ListenResponse"/>
        <outfault message="ErrorMessage"/>
    </operation>
</interface>
</definitions>

Multiple Interacting
Services

Single Service

Messaging

WSDL-based   ebXML-based   Semantic-based

The WSDL-based "Stack"

Includes 3 specifications:
(i) Web Service Context (WS-CTX)
(ii) Web Service Coordination Framework (WS-CF)
(iii) Web Service Transaction Management (WS-TXM)

UDDI	*repository & discovery*
WS-Transaction / WS-Coordination / WS Composite Application Framework (WS-CAF)	*transaction management*
WS-CDL / WSCI	*choreography*
WS-BPEL / WSFL, XLANG / BPML	*orchestration*
WSCL, CS-WS	*conversation description / interaction protocol*
WS-Policy, WSLA	*non-functional features, QoS*
WS-DL	*description (interface definition)*
WS Reliable Messaging	*advanced messaging*
WS-Routing, WS-Addressing	
XML Protocol – XMLP (SOAP)	*basic messaging*
XML & XML Schema, …	*content*
HTTP, SMTP, …	*transport*

Formerly BPEL4WS (BPEL for short)

Both the Web Service Conversation Language (WSCL, by HP) and Conversation Support for Web Services (CS-WS, by IBM) proposals are no more supported

(i) formerly also WSEL (Web Service Endpoint Language) by IBM
(ii) also the research/accademic proposal Web Service Offering Language [WSOL]

31

Conversations

A service is not simply a set of independent operations

- **Using a service typically involves performing sequences of operations in a particular order (conversations)**

- **During a conversation, the client typically chooses the next operation to invoke (on the basis of previous results, etc.) among the ones that the service allows at that point**

(1) requestQuote
(2) orderGoods
Client → Service
(3) confirmOrder
(4) makePayment

[requestQuote]

Composition

Deals with the implementation of an application (in turn offered as a service) whose application logic involves the invocation of operations offered by other services

- **The new service is the *composite* service**
- **The invoked services are the *component* services**

The Composition Engine/Middleware

Through the development environment, a **composition schema** is **synthesized**, either manually or (semi-)automatically. A service composition model and a language (maybe characterized by a graphical and a textual representation) are adopted

Orchestration: the run-time environment executes the composite service business logic by invoking other services (through appropriate protocols)

Component services offered by other providers

Web service composition middleware

development environment

run-time environment (orchestration engine)

schema definitions

composite service execution data

other Web Services middleware (e.g., SOAP invocation engine)

composition schema

composition schema designer

Composite service provider

[from ACKM04]

Supplier WS

Warehouse WS

Accounting WS

Synthesis and Orchestration

(Composition) Synthesis: building the specification of the composite service (i.e., the composition schema)
- Manual
- Automatic

Orchestration: the run-time management of the composite service (invoking other services, scheduling the different steps, etc.)
- Composition schema is the "program" to be executed
- Similarities with WfMSs (Workflow Management Systems)

Composition Schema

A composition schema specifies the "process" of the composite service
- The "workflow" of the service

Different clients, by interacting with the composite service, satisfy their specific needs (reach their goals)
- A specific execution of the composition schema for a given client is an orchestration instance

Choreography (Coordination) vs. Composition (Orchestration)

Composition is about implementing new services
- From the point of view of the client, a composite service and a basic (i.e., implemented in a traditional programming language) one are indistinguishable

Choreography is about global modeling of N peers, for proving correctness, design-time discovery of possible partners and run-time bindings

N.B.: There is a strong relationship between a service internal composition and the external choreographies it can participate in
- if A is a composite service that invokes B, the A's composition schema must reflect the coordination protocol governing A – B interactions
- in turn, the composition schema of A determines the coordination protocols that A is able to support (i.e., the choreographies it can participate in)

Business Process Execution Language for Web Services (WS-BPEL)

Allows specification of composition schemas of Web Services
- Business processes as coordinated interactions of Web Services
- Business processes as Web Services

Allows abstract and executable processes

Influenced from
- Traditional flow models
- Structured programming
- Successor of WSFL and XLANG

Component Web Services described in WS-DL (v1.1)
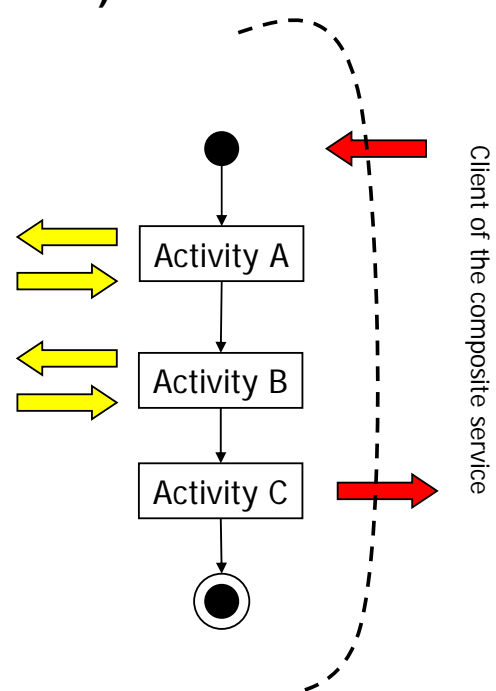

WS-BPEL Specification

An XML document specifying

Roles exchanging messages with the composite service/process

The (WSDL) interfaces supported by such roles

The orchestration of the process

- **Variables and data transfer**
- **Exception handling**
- **Correlation information**

> **roles**

> **interfaces**
> **Orchestration**
> **- variables and data transfers,**
> **- exception handling,**
> **- correlation information (for instance routing)**

invoke checkShipAvailable

invoke cancelOrder

invoke confirmOrder

supplier

41
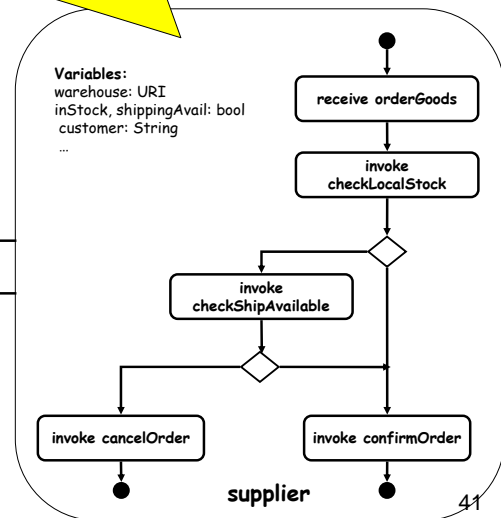

Process Model
(Activities)

Primitive

- `invoke`: **to invoke a Web Service (in-out) operation**
- `receive`: **to wait for a message from an external source**
- `reply`: **to reply to an external source message**
- `wait`: **to remain idle for a given time period**
- `assign`: **to copy data from one variable to another**
- `throw`: **to raise exception errors**
- `empty`: **to do nothing**

Structured

- `sequence`: **sequential order**
- `switch`: **conditional routing**
- `while`: **loop iteration**
- `pick`: **choices based on events**
- `flow`: **concurrent execution (synchronized by ~~links~~)**
- `scope`: **to group activities to be treated "transactionally" (managed by the same fault handler, within the same transactional context)**

> **A link connects exactly one source activity S to exactly one target activity T; T starts only after S ends. An activity can have multiple incoming (possibly with join conditions) and outgoing links. Links can be guarded**

42

Process Model
(Data Manipulation and Exception Handling)

Blackboard approach
- **a blackboard of variables is associated to each orchestration instance (i.e., a shared memory within an orchestration instance)**
- **variables are not initialized at the beginning; they are modified (read/write) by assignments and messages**
- **manipulation through XPath**

Try-catch-throw approach
- **definition of fault handlers**
- **… but also event handlers and compensation handlers (for managing transactionality as in the SAGA model)**

43

Choreography
(As Reported in Literature: Classical Ballet Style)

Consider a dance with more than one dancer
- **Each dancer has a set of steps that they will perform. They orchestrate their own steps because they are in complete control of their domain (their body)**
- **A choreographer ensures that the steps all of the dancers make is according to some overall, pre-defined scheme. This is a choreography**
- **The dancers have no control over the steps they make: their steps must conform to the choreography**
- **The dancers have a single view-point of the dance**
- **The choreographer has a multi-party or global view-point of the dance**

44

Choreography
(A Possible Evolution: Jam Session Style)

Consider a jazz band with many players

- **There is a rhythm and a main theme. This is the choreography**
- **Each player executes his piece by improvising variations over the main theme and following the given rhythm**
- **The players still have a single view-point of the music; in addition they have full control over the music they play**
- **There is a multi-party or global view-point of the music, but this is only a set of "sketchy" guidelines**

45

WS-BPEL vs. WS-CDL

Orchestration/WS-BPEL is about describing and executing a single peer

**Choreography/WS-CDL is about describing and guiding a global model
(N peers)**

You should derive the single peer from the global model by projecting based on participant

46

WS-CDL Basics (1)

Participants & Roles
- **Role type**
  - Enumerate the observable behavior that a collaborating participant exhibits
  - Behavior type specifies the operations supported
    - Optional WSDL interface type
- **Relationship type**
  - Specify the mutual commitments, in terms of the Roles/Behavior types, two collaborating participants are required to provide
  - Note: all multi-party relationships are transformed into binary ones
- **Participant type**
  - Enumerate a set of one or more Roles that a collaborating participant plays

WS-CDL Basics (2)

Channels
- **A channel realizes a *dynamic* point of collaboration, through which collaborating participants interact**
  - Where & how to communicate a message
    - Specify the *Role/Behavior* and the *Reference* of a collaborating participant
    - Identify an *Instance* of a Role
  - Identify an instance of a conversation between two or more collaborating participants
    - A conversation groups a set of related message exchanges

One or more channel(s) MAY be passed around from a Role to one or more other Role(s), possibly in a daisy fashion through one or more intermediate Role(s), creating new points of collaboration dynamically

- **A Channel type MAY restrict the types of Channel(s) allowed to be exchanged between the Web Services participants, through this Channel**
- **A Channel type MAY restrict its usage, by specifying the number of times a Channel can be used**

WS-CDL Basics (3)

Activities are the building blocks of a choreography

- **Basic Activity**
    - Interaction: **message exchange between participants**
        - **Only in-out and in-only**
    - Assign: **within one role, assign the value of a variable to another one**
        - **Variables can be about information (exchanged documents), states and channels**
    - No action: **do null**
- **Ordering structure**
    - Sequence **(P.Q)**
    - Parallel **(P | Q)**
    - Choice **(P + Q)**

Attention: *a choreography performing another one is referred to as "choreography composition" in the standard*

- Perform: **a complete, separately defined choreography is performed**
    - **Basis for scalable modeling**

WS-CDL Basics (4)

A Choreography combines all previous elements, forming a collaboration unit of work

- **Enumerate all the binary relationships interactions act in**
- **Localize the visibility of variables**
    - **Using variable definitions**
- **Prescribe alternative patterns of behavior**
    - **Using work/units and reactions**
- **Enable Recovery**
    - **Using work/units and reactions**
    - **Backward: handle exceptional conditions**
    - **Forward: finalize already completed activities**

Introducing Automatic Composition

Automatic Composition Synthesis (1)

Given:
- **a set (S_1, …, S_n) of component services**
- **a client service request T**

Automatically build:
- **a composition schema CS that fulfills T by suitably orchestrating (S_1, …, S_n)**
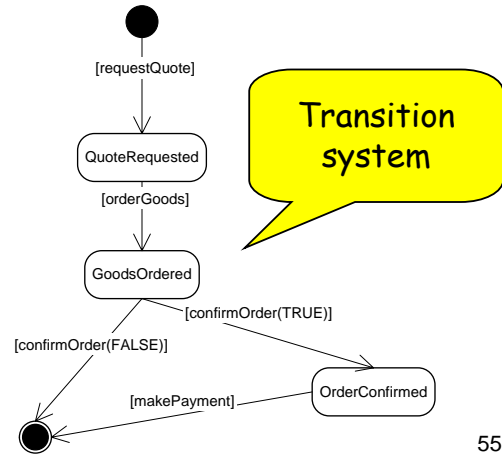

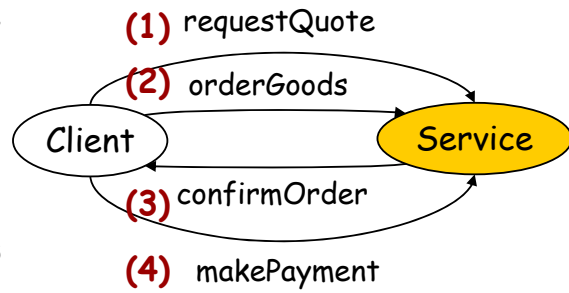

Automatic Composition Synthesis (

Synthesis Engine

Abstraction Module

Realization Module

Abstract specification of the composition schema (e.g., TS)

Abstract service descriptions (e.g., TSs)

WSDL + behavioral descriptions (i.e., specifications of supported conversations) of services

Client service request

WS-BPEL specification of the composite service to be enacted

[Berardi etal VLDB-TES04]

53
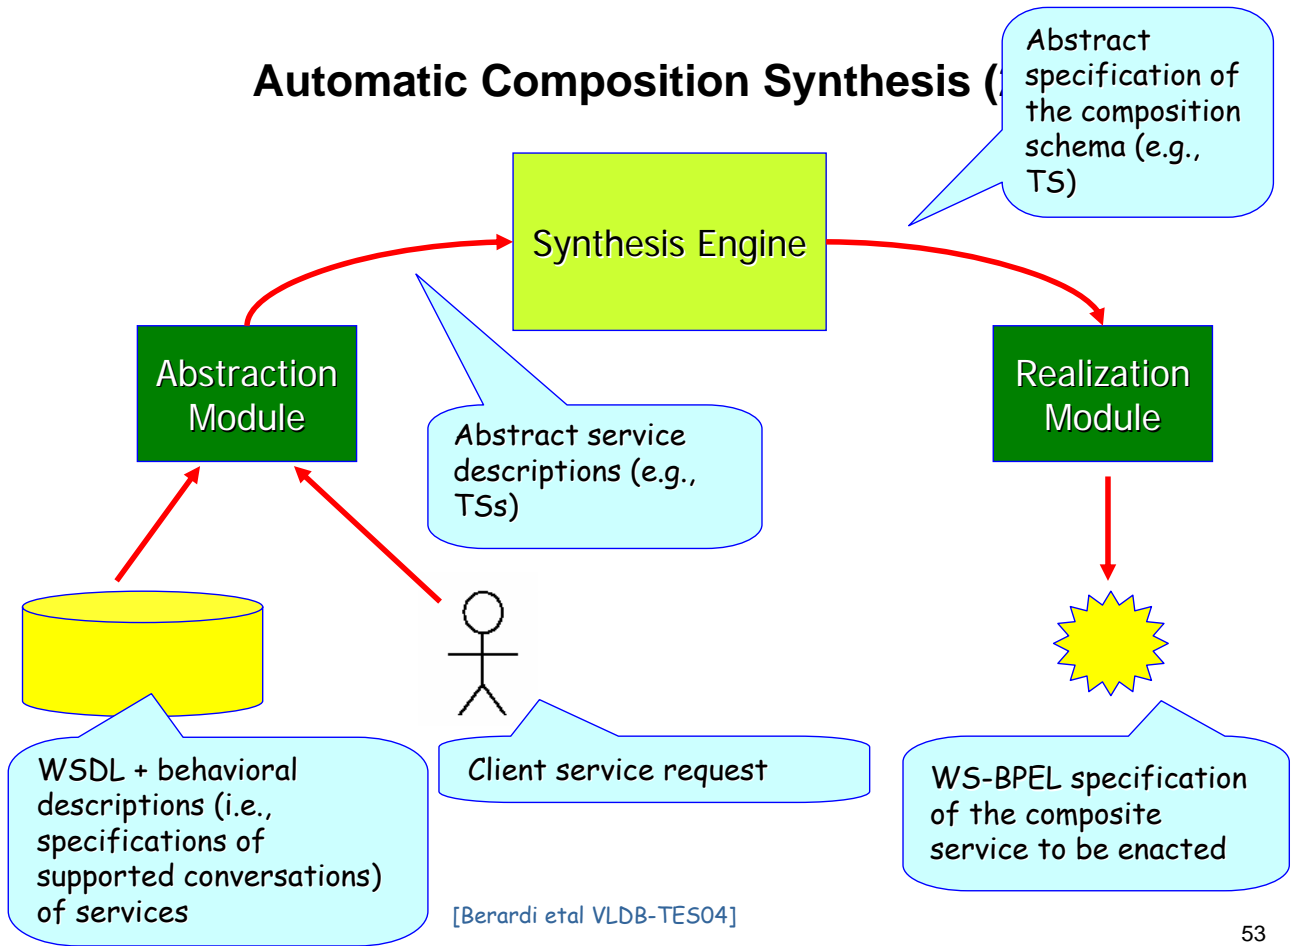

Abstracting over Technologies

Modeling Services as Transition Systems

Services

- A service is characterized by the set of (atomic) operations that it exports …

  … and possibly by constraints on the possible conversations

  - **Using a service typically involves performing sequences of operations in a particular order (conversations)**
  - **During a conversation, the client typically chooses the next operation to invoke (on the basis of previous results, etc.) among the ones that the service allows at that point**

(1) requestQuote
(2) orderGoods
(3) confirmOrder
(4) makePayment

Client — Service

[requestQuote]
QuoteRequested
[orderGoods]
GoodsOrdered
[confirmOrder(TRUE)]
[confirmOrder(FALSE)]
[makePayment]
OrderConfirmed

Transition system

Transition Systems

A transition system (TS) is a tuple $T = < A, S, S^0, \delta, F >$ where:

- **A is the set of actions**
- **S is the set of states**
- **$S^0 \subseteq S$ is the set of initial states**
- **$\delta \subseteq S \times A \times S$ is the transition relation**
- **$F \subseteq S$ is the set of final states**

Choice$_B$
Choice$_L$
Process Algebras and TSs

Process theory:

- a process is a term of an algebraic language
- a transition $E \rightarrow_a F$ means that process E may become F by performing (participating in, or accepting) action a
- structured rules guide the derivation
A graph:

- nodes are process terms
- labelled directed arcs between nodes

$Ven = 2p.2pInserted + 1p.1pInserted$

$2pInserted = big.Choice_B$

$1pInserted = little.Choice_L$

$Choice_B = collect_B.Ven$

$Choice_L = collect_L.Ven$

Automata vs. Transition Systems

Automata

- define sets of runs (or traces or strings): (finite) length sequences of actions

TSs

- … but I can be interested also in the alternatives "encountered" during runs, as they represent client's "choice points"

As automata they recognize the same language: abc* + ade*

Different as TSs
WS-DL is the Set of Actions

A message exchange pattern (and the related operation) represents an **interaction** with the service client

- an action that the service can perform by interacting with its client

Abstracting from formal parameters, we can associate a different symbol to each operation …

… thus obtaining the alphabet of actions

An Example

The **MP3ServiceInterface** defines 3 actions:

- **search_by_title / st**
- **search_by_author / sa**
- **listen / l**

Formally A = {st,sa,l}

From a TS to WS-BPEL (1)

```
Transition
System
```

Mapping transitions

```
Transition
Skeletons
```

Mapping states

```
State
Skeletons
```

Connecting state skeletons on the basis of the graph

```
WS-BPEL Specification
Skeleton
```

```xml
<process name = "…">

    <partnerLinks>
     …
    </partnerLinks>

    <variables>
     …
    </variables>

    <flow>
        <links>
          …
        </links>
        <!-- state skel. -->
        …
        <!-- state skel. -->
    </flow>

</process>
```
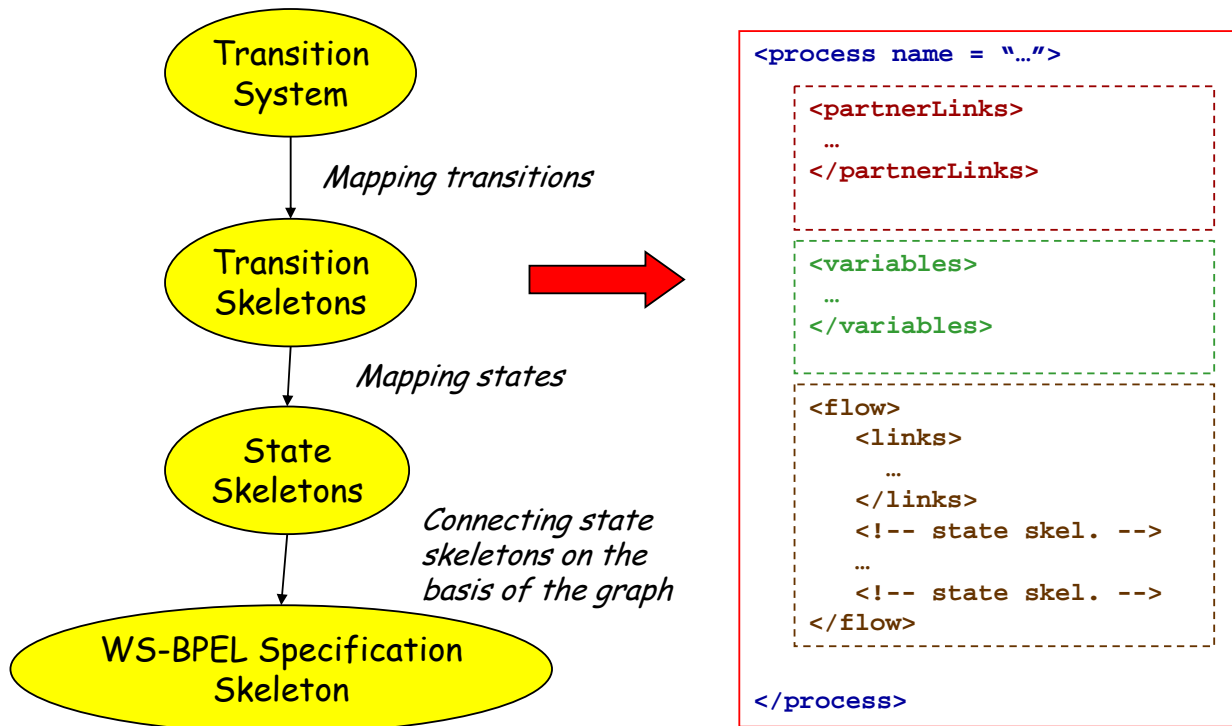

From a TS to WS-BPEL (2)

Intuition [Baina etal CAISE04, Berardi etal VLDB-TES04]

1. **Each transition corresponds to a WS-BPEL pattern consisting of *(i)* an** `<onMessage>` **operation (in order to wait for the input from the client of the composite service), *(ii)* followed by the effective logic of the transition, and then *(iii)* a final operation for returning the result to the client. Of course both before the effective logic and before returning the result, messages should be copied forth and back in appropriate variables**
2. **All the transitions originating from the same state are collected in a** `<pick>` **operation, having as many** `<onMessage>` **clauses as transitions originating from the state**
3. **The WS-BPEL file is built visiting the graph in depth, starting from the initial state and applying the previous rules.**

N.B.: (1) and (2) works for in-out interactions (the ones shown in the following). Simple modifications are needed for in-only, robust-in-only and in-optional-out. The other kinds of interactions implies a proactive behaviour of the composite service, possibly guarded by `<onAlarm>` **blocks.**
(3) works for acyclic TS. See later for cycle management.

Transition Skeletons

```
<onMessage … >
        <sequence>
                <assign>
                   <copy>
                      <from variable="input" ... />
                      <to variable="transitionData" ... />
                   </copy>
                </assign>
                < !-- logic of the transition -->
                <assign>
                   <copy>
                      <from variable="transitionData" ... />
                      <to variable="output" ... />
                   </copy>
                </assign>
                <reply ... />
        </sequence>
</onMessage>
```

State Skeletons

N transitions from state S_i are mapped onto:

```
<pick name = "Si">
        <!-- transition #1 -->
        <onMessage … >
           <!-- transition skeleton -->
        </onMessage>
        … … …
        <!-- transition #N -->
        <onMessage … >
           <!-- transition skeleton -->
        </onMessage>
</pick>
```

Mapping the TS

All the `<pick>` blocks are enclosed in a surrounding `<flow>`; the dependencies are modeled as `<link>`s

- `<link>`s are controlled by specific variables S_i-to-S_j that are set to TRUE iff the transition $S_i \rightarrow S_j$ is executed
- Each state skeleton has many outgoing `<link>`s as states connected in output, each going to the appropriate `<pick>` block

Mapping Cyclic TSs
(Intuition)

Identify all the cycles

Enclose the involved state skeletons inside a `<while>` block controlled by a condition `(!exit)` (`exit` is a variable defined ad hoc)

- `exit` is set to TRUE by any transition that "goes out" of the cycle
- The overall `<while>` block is connected to other state skeletons by appropriate `<link>`s

Special cases:

- A state S with self-transitions can be represented as a `<pick>` block enclosed in a `<while>` block controlled by a condition (V_s) (the variable V_s is set to FALSE by other non self-transitions)
- Cycles starting from the initial state should not be considered, as they can be represented as the start of a new instance

An Example (1)

```
<partnerLinks>
    <!-- The "client" role represents the requester of this composite service -->
        <partnerLink name="client"
                partnerLinkType="tns:Transition"
                myRole="MP3ServiceTypeProvider"
                partnerRole="MP3ServiceTypeRequester"/>
        <partnerLink name="service"
                partnerLinkType="nws:MP3CompositeService"
                myRole="MP3ServiceTypeRequester"
                partnerRole="MP3ServiceTypeProvider"/>
</partnerLinks>
```

An Example (2)

```
<variables>
    <variable name="input" messageType="tns:listen_request"/>
    <variable name="output" messageType="tns:listen_response"/>
    <variable name="dataIn" messageType="nws:listen_request"/>
    <variable name="dataOut" messageType="nws:listen_response"/>
</variables>

    <pick>
        <onMessage partnerLink="client"
                portType="tns:MP3ServiceType"
                operation="listen"
                variable="input">
                <sequence>
                    <assign>
                        <copy>
                            <from variable="input" part="selectedSong"/>
                            <to variable="dataIn" part="selectedSong"/>
                        </copy>
                    </assign>
                    … …
                    <assign>
                        <copy>
                            <from variable="dataOut" part="MP3FileURL"/>
                            <to variable="output" part="MP3FileURL"/>
                        </copy>
                    </assign>
                    <reply name="replyOutput"
                        partnerLink="client"
                        portType="tns:MP3ServiceType"
                        operation="listen"
                        variable="output"/>
                </sequence>
        </onMessage>
        … …
    </pick>
```

An Ex...

```
<process suppressJoinFailure = "no">
  <flow>
   <links>
     <link name="start-to-1"/>
     <link name="start-to-2"/>
   </links>

   <pick createInstance = "yes">
     <onMessage="sa">
       <sequence>
         <copy>...</copy>
         … …
         <copy>...</copy>
         <reply ... />

       </sequence>
     </onMessage>
     <onMessage="st">
       <sequence>
         <copy>...</copy>
         … …
         <copy>...</copy>
         <reply ... />
       </sequence>
     </onMessage>
     <source linkName="start-to-1" transitionCondition = "bpws:getVariableData('start-to-1') = 'TRUE' " />
     <source linkName="start-to-2" transitionCondition = "bpws:getVariableData('start-to-2') = 'TRUE' " />
   </pick>
```

A new instance is created in the initial state. This resolve also the presence of the cycles without the need of enclosing `<while>`

The ‹sa› transition skeleton should set variables:
```
start-to-1 = TRUE
start-to-2 = FALSE
```

The ‹st› transition skeleton should set variables:
```
start-to-1 = FALSE
start-to-2 = TRUE
```

An Example (4)

```
     <pick>
       <onMessage="l">
         <sequence>
           <copy>...</copy>
           … …
           <copy>...</copy>
           <reply ... />
         </sequence>
       </onMessage>
       <target linkName="start-to-1" />
     </pick>
     <pick>
       <onMessage="l">
         <sequence>
           <copy>...</copy>
           … …
           <copy>...</copy>
           <reply ... />
         </sequence>
       </onMessage>
       <target linkName="start-to-2" />
     </pick>
</process>
```

TSs and Choreography
(only an intuition :-))

A Choreography can be seen as the specification of a set of concurrent peers, each one exposing a TS, that fulfills the global model

State of the Art on Service Composition (approfondimento opzionale)

Service Composition System

Service composition

How to model client request ?
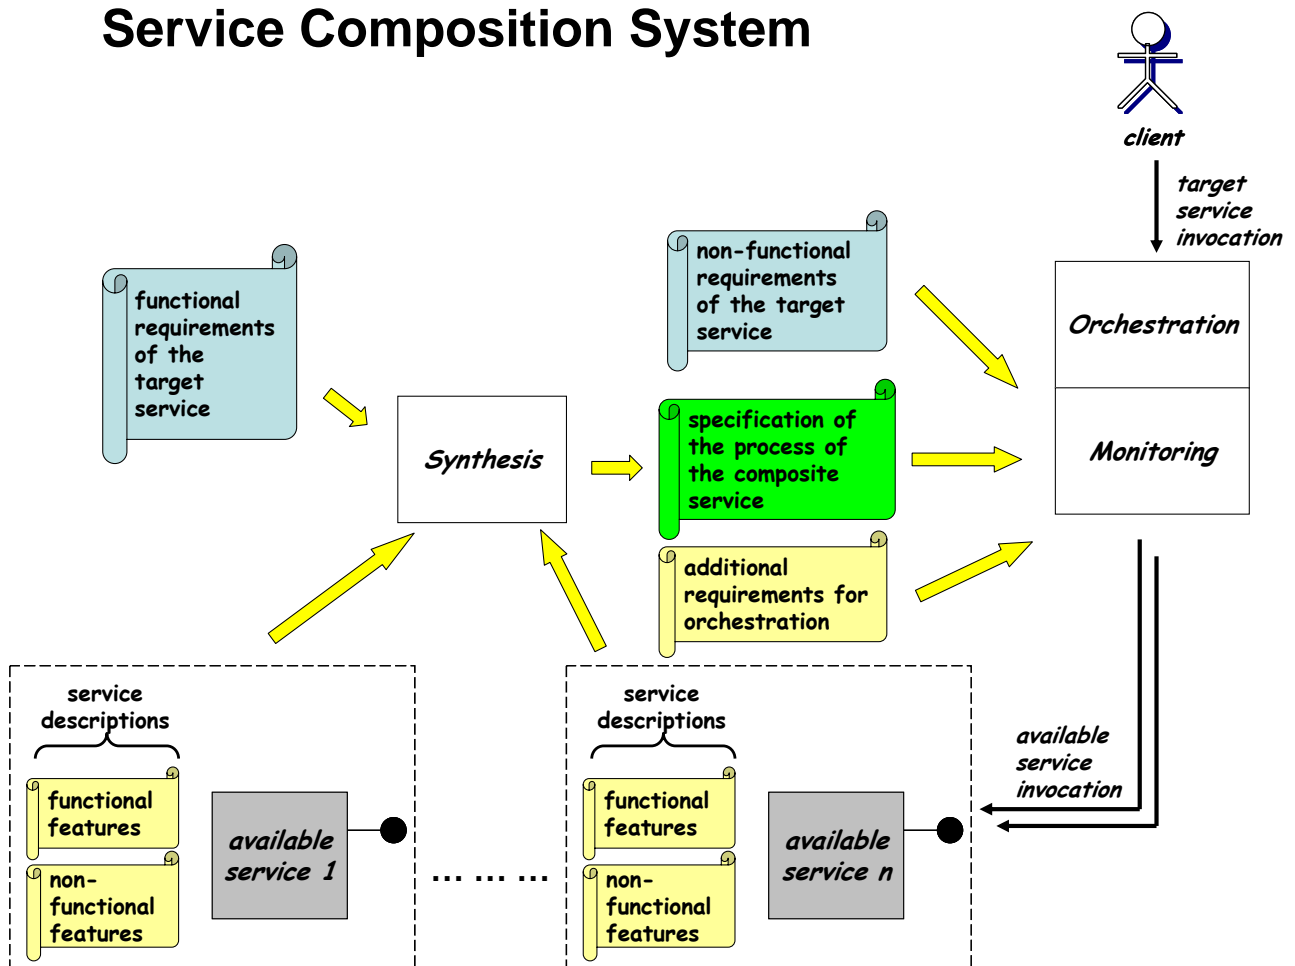

Composition Synthesis:
Input:
- client request
- set of available services

 Output:
– specification of composite service

How to model available services ?

How to model the composite service ?

2. Orchestration:
 Input:
- specification of composite service
 Output:
- coordination of available services composition schema
- data flow and control flow monitoring

according to the

How to orchestrate the composite service ?

78

Service description

Services export a **view of their behavior**

- **I/O interface**
    - **Data Access**
      focus on data
      for information gathering
    - **Atomic Actions**
      focus on actions
      world altering services

- **Complex Behavioral Description**
  (typically represented using finite states, e.g., TSs)

> information oriented services

> services as atomic actions

> services as processes

The whole picture

> Diagram inspired from Hull&Su 2004 SIGMOD tutorial

Statics of the system

Papazoglou's group *

Bouguettaya's group *

Composition as (classical) planning

Knoblock's group

Traverso's group

McIlraith's group

The Roman group

Hull's group

Dynamics of target service

Dynamics of component services

* do not tackle automatic composition
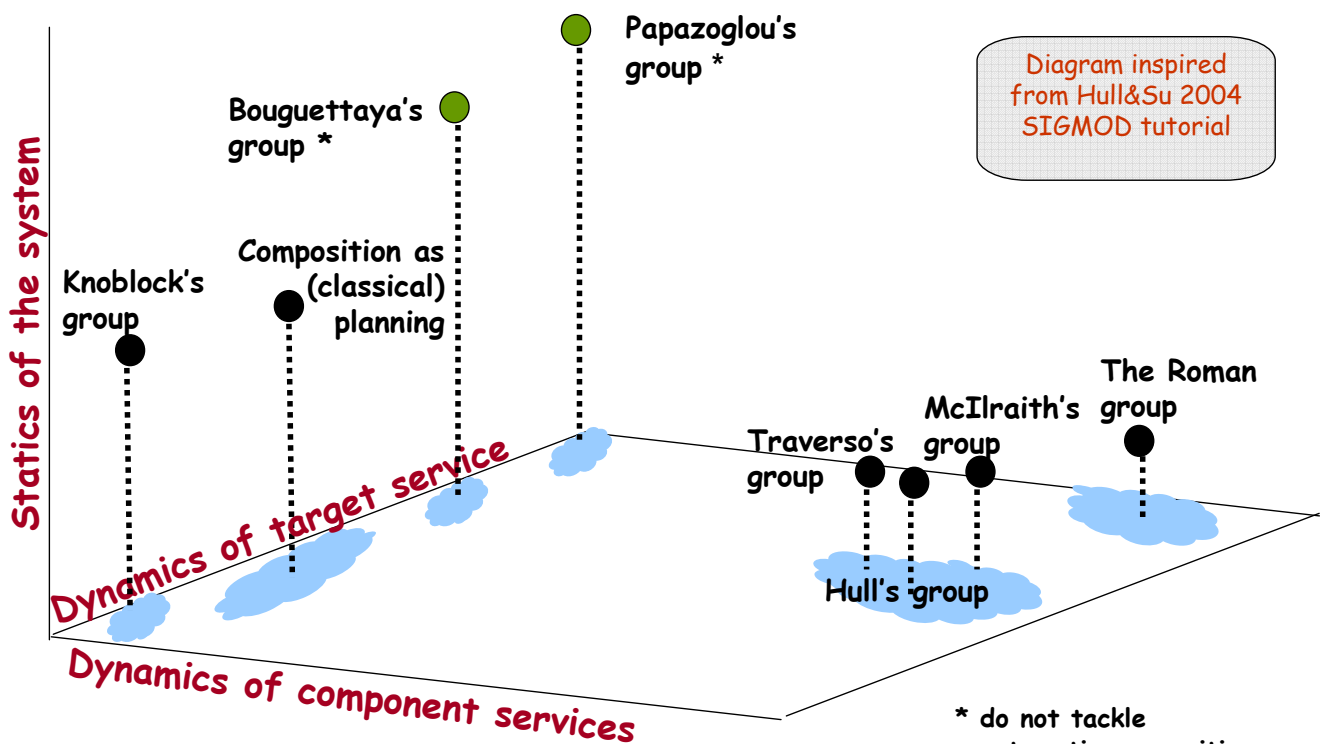

Key dimensions in service composition (1)

Statics of the composition system
(i.e., static semantics):

- **e.g, ontologies of services (for sharing semantics of data/information), inputs and outputs, etc.**

Dynamics of component services
(i.e., dynamic semantics, process):

- **e.g., behavioral features, complex forms of dataflow, transactional attitudes, adaptability to varying circumstances**

Key dimensions in service composition (2)

Dynamics of the target service
(i.e., dynamic semantics, process)

The target service exposed as:

atomic
action

- **single step**
- **(set of) sequencial steps**
- **(set of) conditional steps**
- **while/loops, running batch**
- **while/loops, running under an external control**

process

Key dimensions in service composition: the 4ᵗʰdimension

Degree of (in)completeness in the
specification of:

- **Static Aspects (of the composition system)**
- **Dynamic Aspects (of component services)**
- **Target service specification**

Note: Orthogonal to previous dimensions

> For simplicity not shown in the following slides

What is addressed from the technical point of view?

Automatic composition techniques?

- **Which formal tools?**
- **Sound and complete techniques?**
- **Techniques/Problem investigated from computational point of view?**

Analyzed works

Papazoglou's group

Bouguettaya's group   (not automatic composition)

Knoblock's group (information oriented services)

Composition as Planning (services as atomic actions)

Traverso's group

McIlraith's group

Hull's group   (services as processes)

The Roman group

as called by Rick Hull in his SIGMOD 2004 tutorial

Papazoglou's group

J. Yang and M.P. Papazoglou: Service Components for Managing the Life-cycle of
Service Compositions, Information Systems 29 (2004), no. 2, 97 – 125

available services: I/O interfaces
- service component: simple or complex pre-existing service wrapped into a web component
- they are stored in a service component class library
- operations offered through a uniform interface

composite service: complex behavioral description
- set of service components (from service component class library) "glued" together by composition logics
  - composition logics defines execution order (either sequential or concurrent) of service components within composition, dependencies among input and output parameters, etc.
- support for manual composition: designer specifies composite service using the Service Scheduling Language and the Service Composition Execution Language

Papazoglou's group
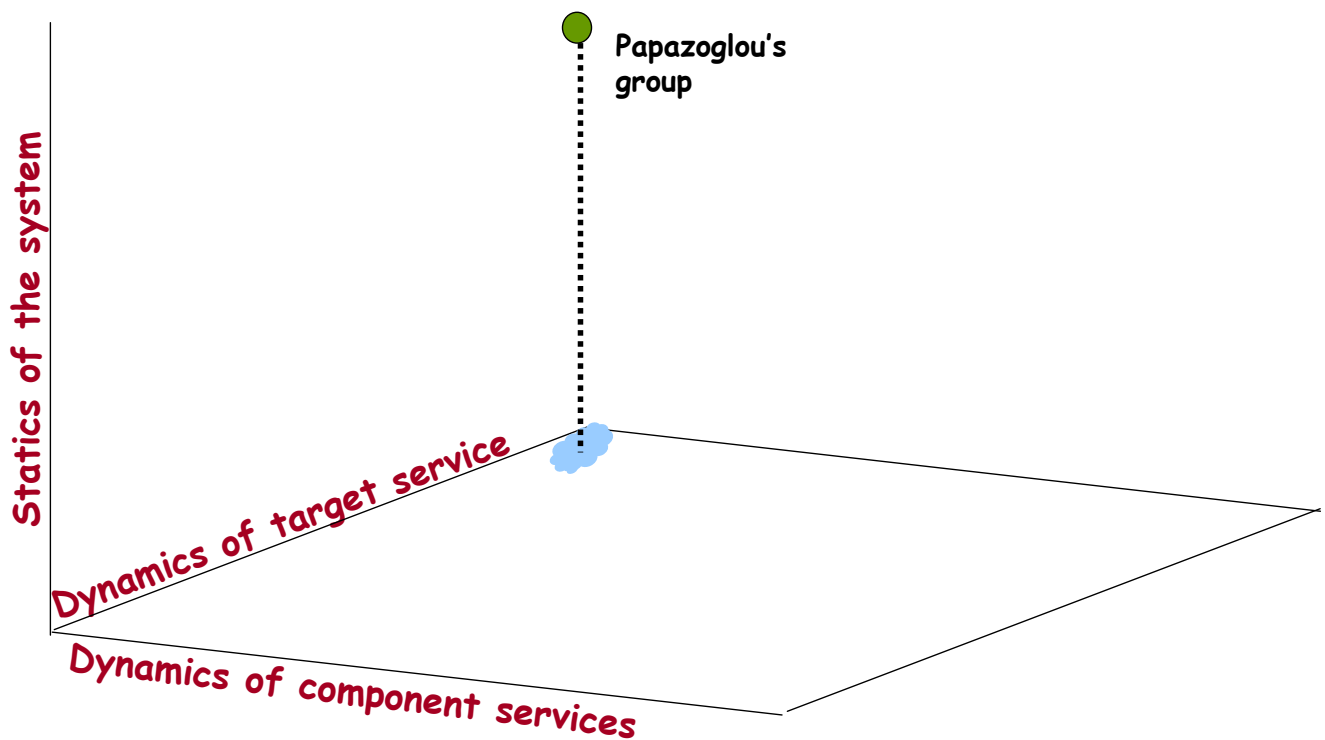

Bouguettaya's group

B. Medjahed, A. Bouguettaya, and A. K. Elmagarmid: Composing Web services on the
Semantic Web, Very Large Data Base Journal 12 (2003), no. 4, 333–351

available services: atomic actions

- semantically described in terms of their I/O interfaces
  and non-functional properties such as their purpose,
  their category and their quality
- Available services stored into an ontology on the basis
  of their non-functional properties

Bouguettaya's group

client request:

- **expressed in the Composite Service Specification Language (CSSL): it specifies the sequence of desired operations that the composite service should perform and control flow between operations**

service composition problem:

- Input: *(i)* **I/O descr. of available services**
     (ii) **client request expr. in CSSL**

- Output: **composite service as sequence of operations (semi-automatically) obtained from the client specification by identifying, for each operation, the operation(s) of available services that matches it, on the basis of their I/O interface and non-functional features**
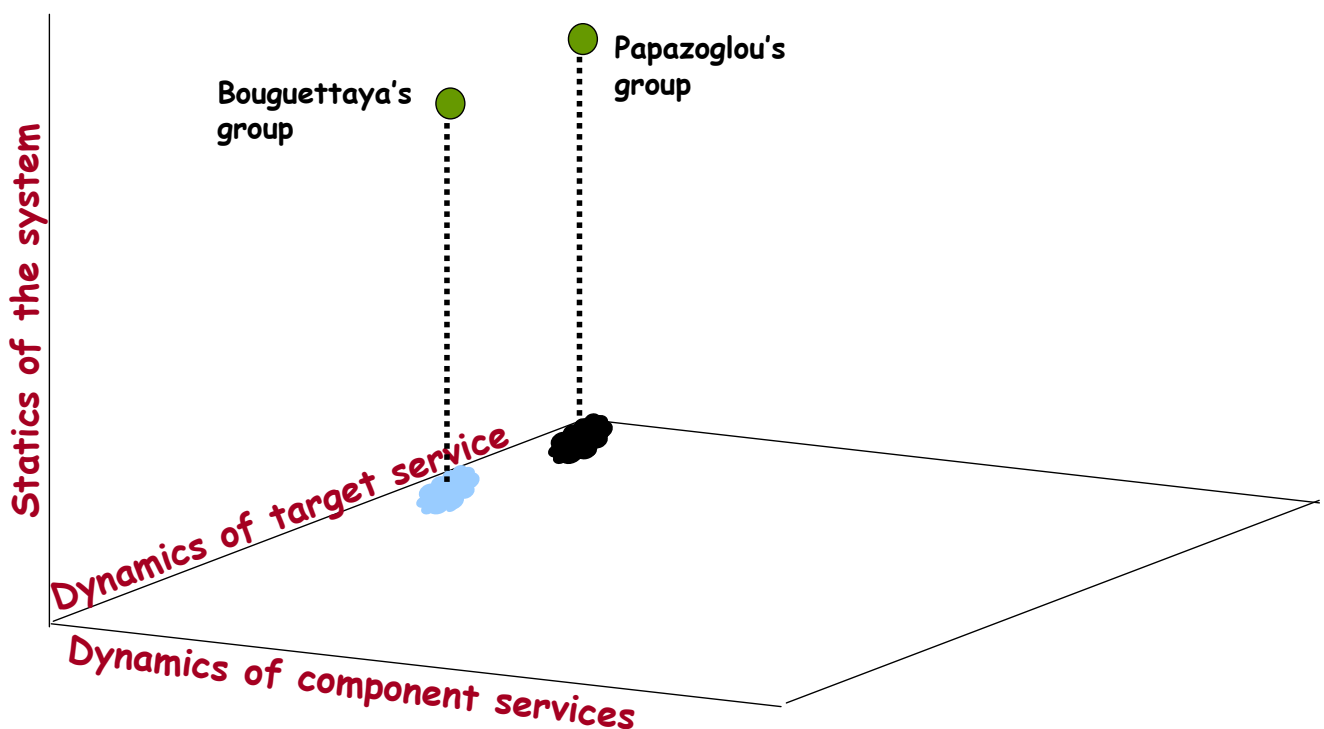

Bouguettaya's group

Knoblock's group

available service: **data query**

- **basic idea: informative services as views over data sources**
- **each service described in terms of I/O parameters (of course, the latter being provided by the data source), binding patterns and additional constraints on the source**

client request:

- **data query, expressed in terms of inputs provided by the client and requested outputs**

Knoblock's group

service composition problem**:**

- <u>Input</u>: *(i)* **available services modeled as data-sources, and** *(ii)* **client request as user query**
- <u>Output</u>**: (automatically obtained) composite service as integration plan for a *generalized* user query, so that all the user queries that differ only for intensional input values can be answered by the same (composite) service. Integration plan as a sequence of source queries, taking binding pattern into account**

Knoblock's group

Statics of the system

Papazoglou's group

Bouguettaya's group

Knoblock's group

Dynamics of target service

Dynamics of component services
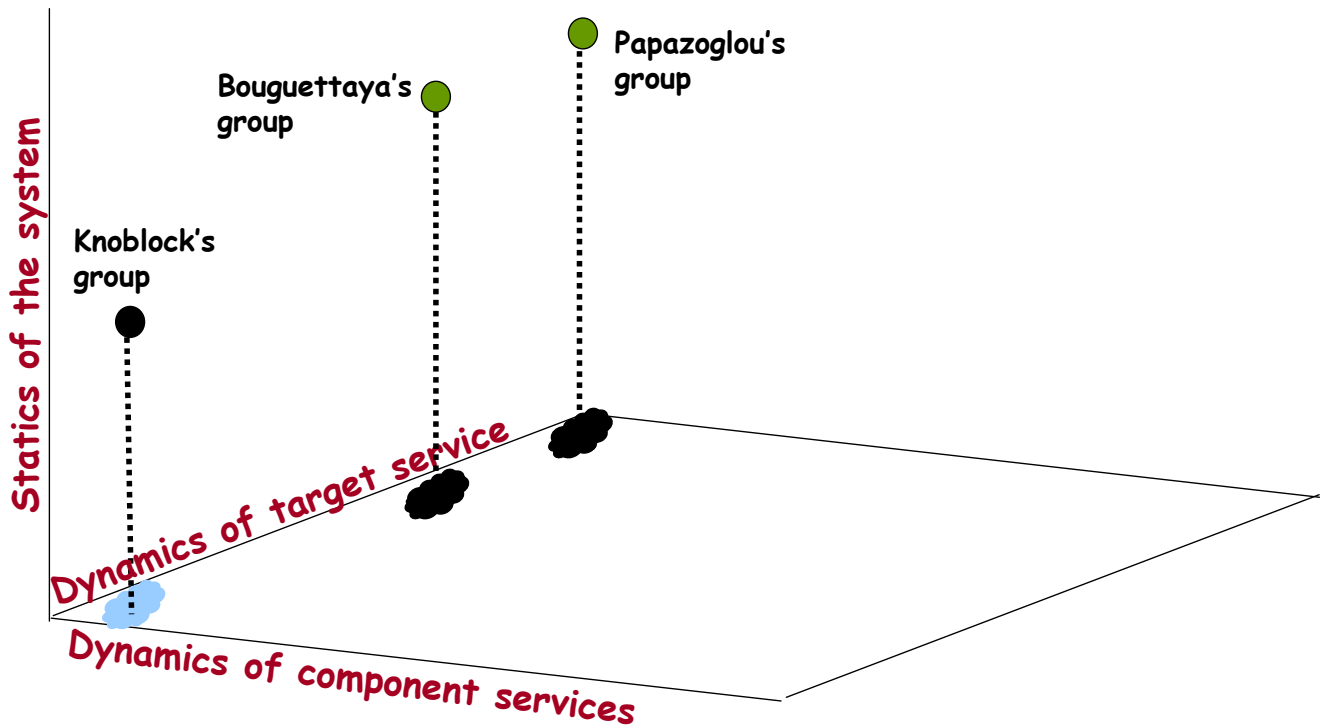

Composition as Planning

available services: atomic actions

client request: client (propositional) goal

service composition problem: planning problem

- Input: *(i)* **client goal (also encodes initial condition)**
  (ii) **available services as atomic actions**

- Output: **composite service as a (possibly conditional) plan, i.e., sequence of actions that transform the initial state into a state satisfying the goal.**
  - *Sirin, Parsia, Wu, Hendler & Nau [Sirin etal ICWS03]*
  - **ICAPS 2003 Planning for Web Services workshop** *[P4WS03]*
  - **ICAPS 2004 Planning for Web and Grid Services workshop** *[P4WGS04]*

NOTE: the client has not influence over the control flow of the composite service

Example (1)

Component Services
- S_1**: True → {S_1:bookFlight} FlightBooked ∧ MayBookLimo**
  MayBookLimo → {S_1:bookLimo} LimoBooked

- S_2**: True → {S_2:bookHotel} HotelBooked**
  HotelBooked → {S_2:bookShuttle} ShuttleBooked

- S_3**: True → {S_3:bookEvent} EventBooked**

Ontology:
- **TravelSettledUp ≡ FlightBooked ∧ HotelBooked ∧ EventBooked**
- **CommutingSettled ≡ ShuttleBooked ∨ LimoBooked ∨ TaxiAvailablilityChecked**
- **...**

Client Service Request:
- **Find a composition of the actions (i.e., a sequence, a program using such actions as basic instructions) such that a given property is fulfilled**

Example (2)

Component Services
- S_1: True → {S_1:bookFlight} FlightBooked ∧ MayBookLimo
  MayBookLimo → {S_1:bookLimo} LimoBooked

- S_2: True → {S_2:bookHotel} HotelBooked
  HotelBooked → {S_2:bookShuttle} ShuttleBooked

- S_3: True → {S_3:bookEvent} EventBooked

Ontology:
- TravelSettledUp ≡ FlightBooked ∧ HotelBooked ∧ EventBooked
- CommutingSettled ≡ ShuttleBooked ∨ LimoBooked ∨ TaxiAvailablilityChecked
- ...

Client Service Request:
- **Starting from: ¬FlightBooked ∧ ¬ HotelBooked ∧ ¬EventBooked ∧ ¬CommutingSettled**
- **Achieve: TravelSettledUp ∧ CommutingSettled**

Example (3)

Component Services

- S_1: True $\rightarrow$ {S_1:bookFlight} FlightBooked $\wedge$ MayBookLimo
  MayBookLimo $\rightarrow$ {S_1:bookLimo} LimoBooked

- S_2: True $\rightarrow$ {S_2:bookHotel} HotelBooked
  HotelBooked $\rightarrow$ {S_2:bookShuttle} ShuttleBooked

- S_3: True $\rightarrow$ {S_3:bookEvent} EventBooked

Ontology:

- TravelSettledUp $\equiv$ FlightBooked $\wedge$ HotelBooked $\wedge$ EventBooked
- CommutingSettled $\equiv$ ShuttleBooked $\vee$ LimoBooked $\vee$ TaxiAvailablilityChecked
- ...

Client Service Request:

Starting from:
¬FlightBooked $\wedge$ ¬ HotelBooked $\wedge$ ¬EventBooked $\wedge$ ¬CommutingSettled

achieve:
TravelSettedUp $\wedge$ CommutingSettled

Compositions:

- S_1:bookFlight; S_1:bookLimo; S_2:bookHotel; S_3:bookEvent
- S_3:bookEvent; S_2:bookHotel; S_1:bookFlight; S_2:bookShuttle

---

Another Example (1)

Component Services:

- S_1: Registered $\rightarrow$ {S_1:bookFlight} FlightBooked
  ¬Registered $\rightarrow$ {S_1:register} Registered

- S_2: True $\rightarrow$ {S_2:bookHotel} HotelBooked
  HotelBooked $\rightarrow$ {S_2:bookShuttle} ShuttleBooked

- S_3: True $\rightarrow$ {S_3:bookEvent} EventBooked

Ontology:

- TravelSettedUp $\equiv$ FlightBooked $\wedge$ HotelBooked $\wedge$ EventBooked

Client Service Request:

Starting from:
¬FlightBooked $\wedge$ ¬ HotelBooked $\wedge$ ¬EventBooked

Achieve:
TravelSettedUp

Another Example (2)

Client Service Request:

- **Starting from: ¬FlightBooked ∧ ¬ HotelBooked ∧ ¬EventBooked**
- **Achieve: TravelSettedUp**

What about Registered?

> *The client does not know whether he/she/it is registered or not.*

The composition must resolve this at runtime:

```
if (¬Registered){
   S1:register;
}
S1:bookFlight;
S2:bookHotel;
S3:bookEvent
```

Composition as Planning

Planning is a Rich Area!!!

Sequential Planning (plans are sequences of actions)

Conditional Planning (plans are programs with if's and while's)

Conformant Planning (plans the work in spite of incomplete -non observable- information)

Knowledge Producing Actions/Sensing (distinction between truth and knowledge)

Plan Monitoring

Interleaving Deliberation and Execution

Form of the Goals:

- **Achieve something**
- **Achieve something while keeping something else**
- **Temporal goals**
- **Main goal + exception handling**

Traverso's group

available services:

- **non-deterministic transition systems characterized by a set of initial states and by a transition relation that defines how the execution of each action leads from one state to a set of states**
- **among such services, one represents the client**

client request (called global goal):

- **it specifies a main execution to follow, plus some side paths that are typically used to resolve exceptional circumstances e.g., Do Φ else Try Ψ**

Traverso's group

service composition problem: **(extended) planning problem**
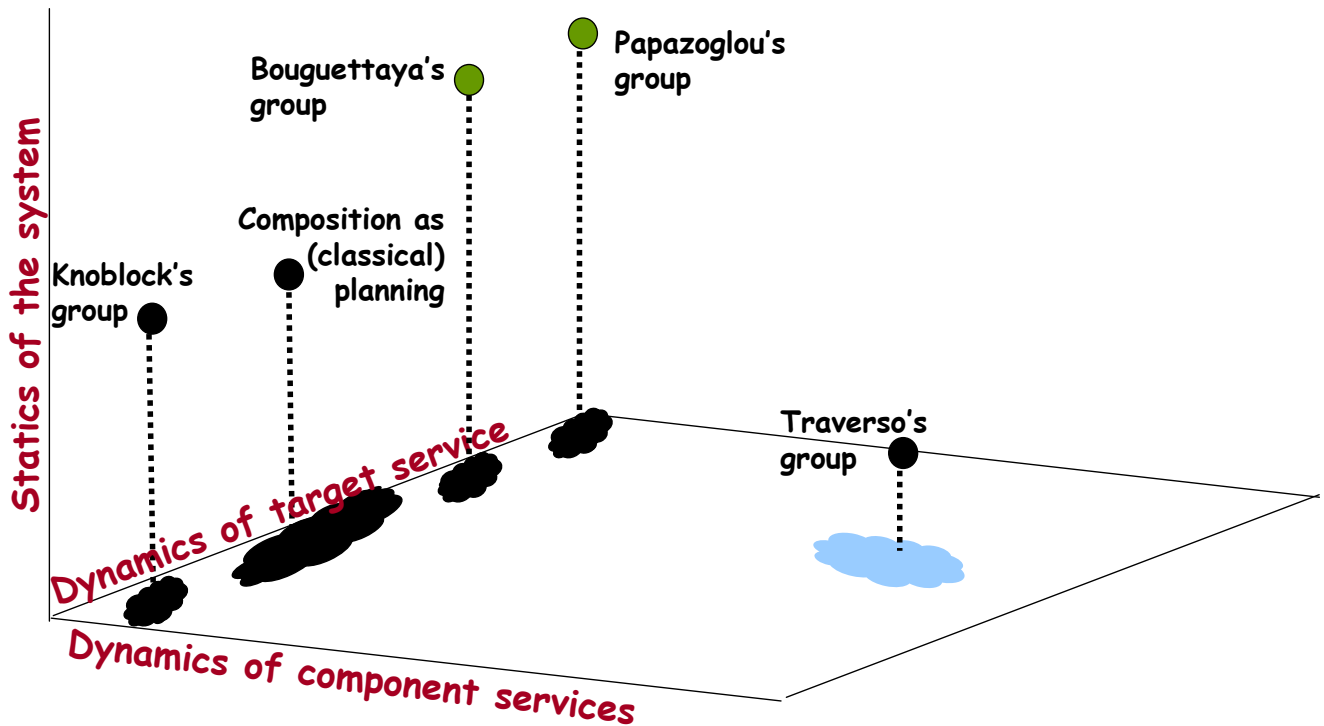

- **<u>Input</u>:** *(i)* **a set of services, including the one representing the client (behavior), and** *(ii)* **the global goal,**
- **<u>Output</u>: a plan that specifies how to coordinate the execution of various services in order to realize the global goal.**

NOTE:

- **the composition is not tailored towards satisfying completely the client requested behavior, but concerns with the global behavior of the system in which some client desired executions may happen not to be fulfilled**

McIlraith's group

both available and composite service: behavioral description seen as procedures invokable by clients

- **Golog procedure, atomically executed, i.e., seen by its client as an atomic Situation Calculus action, presenting an I/O interface**
- **each service stored in an OWL-S ontology**

107

McIlraith's group

client request:

- **skeleton of a Golog procedure expressing also client constraints and preferences**

service composition problem:

- <u>Input</u>: *(i)* **OWL-S ontology of services as atomic actions, and** *(ii)* **client request**
- <u>Output</u>: **Golog procedure obtained by automatically instantiating the client request with services contained in the ontology, by also taking client preferences and constraints into account**

NOTE: the client has not influence over the control flow of the composite service

Hull's group

both available and composite service (peer): behavioral description

- **Mealy machine, that exchanges messages with other peers according to a predefined communication topology (channels among peers)**
- **peers equipped with (bounded) queue to store messages received but not yet processed**
- <u>Conversation</u>**: sequence of messages exchanged by peers**
- **At each step, a peer can either *(i)* send a message, or *(ii)* receive a message, or *(iii)* consume a message from the queue, or *(iv)* perform an empty move, by just changing state**

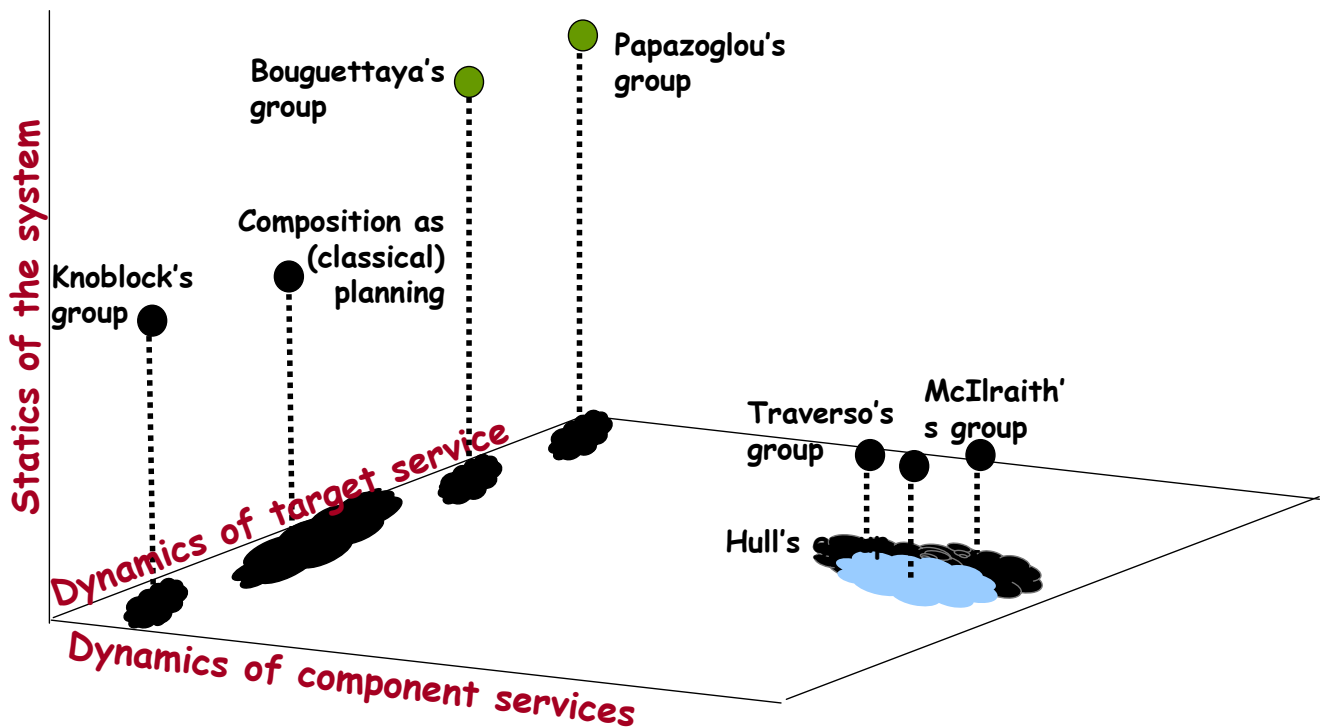

Hull's group

Choreography mapping problem:

- <u>Input</u>*: (i)* **a desired global behavior (i.e., set of desired conversations) as a Linear Temporal Logic formula, and *(ii)* an infrastructure (a set of channels, a set of peer names and a set of messages)**
- <u>Output</u>**: Mealy machines (automatically obtained) for all the peers such that their conversations are compliant with the LTL specification**

NOTE: not yet a "jam session style" choreography

The Roman group

available service: **behavioral description**

- **service as an interactive program: at each step it presents the client with a set of actions among which to choose the next one to be executed**

- **client choice depends on outcome of previously executed actions, but <u>the rationale behind this choice depends entirely on the client</u>**

- **behavior modeled by a finite state transition system, each transition being labeled by a deterministic (atomic) action, seen as the abstraction of the effective input/output messages and operations offered by the service**

The Roman group

client request (target service):

- **set of executions organized in a (finite state) *transition system* of the activities he is interested in doing**

service composition problem:

- <u>Input</u>: *(i)* **finite state transition system of available services, and** *(ii)* **finite state transition system of target service**

- <u>Output</u>**: (automatically obtained) composite service that realizes the client request, such that each action of the target service is delegated to at least one available service, in accordance with the behavior of such service.**

NOTE: the client "strongly" influence the composite service control flow

Other Relevant Works

Approaches proposing interesting conceptual models for services, not targeted towards composition:

- **Vianu 's group**
- **Benatallah & Casati's group**

Vianu's group

available service: data query + behavioral descr.

- **service as a data-driven entity characterized by a database and a tree of web pages**
- **At each step, set of input choices presented to client: some generated as queries over the database; specific client data treated as constants. The client chooses one of such inputs, and in response, the service produces as output updates over the service database and/or performs some actions, and makes a transition from a web page to another**

automatic verification of service properties:

- **both over runs (linear setting) and over sets of runs (branching setting)**
- **they characterize the complexity of verifying such properties for various classes of services**

121

Benatallah & Casati's group

available service: behavioral description

- **behavior of a service as finite state transition system in terms of message exchanged with the clients (conversations)**
- **transitions labeled by messages, and states labeled with the status of the conversation (e.g., effect of the message exchange leading to it, if clearly defined)**

they study how to automatically generate the skeleton of a BPEL4WS spec. starting from the transition system modeling the service behavior

they also study properties of service behavior in order for two services to correctly interact

122

(Only) Orchestration

Two main kinds of orchestration *[Hull etal PODS03]* **:**

- *(i)* **the mediated approach, based on a hub-and-spoke topology, in which one service is given the role of process mediator/delegator, and all the interactions pass through such a service, and**

- *(ii)* **the peer-to-peer approach, in which there is no centralized control**

Mediated Orchestration Engines

e-**Flow** *[Casati & Shan, IS01]* **:**

- **Platform for specifying, enacting and monitoring composite service**

- **Composite** *E*-**Service (CES) is a service process engine offered as (meta-) service that performs coordination of services, with some process adaption/evolution mechanisms**

- **A provider can offer a value added service as coordination of different services: it registers the new service to the CES and let the CES enact its execution**

AZTEC *[Christophides etal TES01]* **:**

- **Framework for orchestration of session-oriented, long running telecommunication services is studied. It is based on <u>active flowcharts</u> thus coping with asynchronous events that can happen during active telecom sessions**

Mediated Orchestration Engines

WISE *[Lazcano etal CSSE2000]* **:**

- **Orchestration engine that coordinates the execution of distributed applications (virtual processes), and a set of brokers enables the interaction with already existing systems that are to be used as building blocks.**
- **Process meta-model based on Petri Nets, with the possibility to add Event-Condition-Action (ECA) rules**

MENTOR-lite *[Shegalov etal VLDBJ01]* :

- **Workow management system based on a XML mediator for coordinating services which are distributed among different organizations and deployed on heterogeneous platforms**
- **Process meta-model is based on a specific statechart dialect**

Peer-to-Peer
Orchestration Engines

Self-Serv *[Benatallah etal IEEE03]* **:**

- **Platform for composing services and executing new composed services in a decentralized way, through peer-to-peer interactions**
- **Composite service modeled as an activity diagram**
- **Its enactment carried out through the coordination of different state coordinators (one for each service involved in the specification and one for the composite service itself)**

PARIDE Orchestrator *[Mecella etal VLDB-TES02]* **:**

- **A composition schema, modeled as a specific Coloured Petri Net, is orchestrated by a set of organizations, which moves it (as a "token") along the execution**
- **Separation between the responsibility of the orchestration and the providing of services (suitable in specific scenarios)**
- **Services can be substituted with other compatibles**

ebXML

(approfondimento opzionale)

ebXML

ebXML is more a standardized "conceptual framework", a "reference model", than a real stack of standard technologies

- *Stable version in 2001/2002*
    - **Technical Architecture Specification (v1.04)**
    - **Business Process Specification Schema (v1.01)**
    - **Registry Information Model (v2.0)**
    - **Registry Services Specification (v2.0)**
    - **Requirements Specification (v1.06)**
    - **Collaboration-Protocol Profile and Agreement Specification (v2.0)**
    - **Message Service Specification (v2.0)**
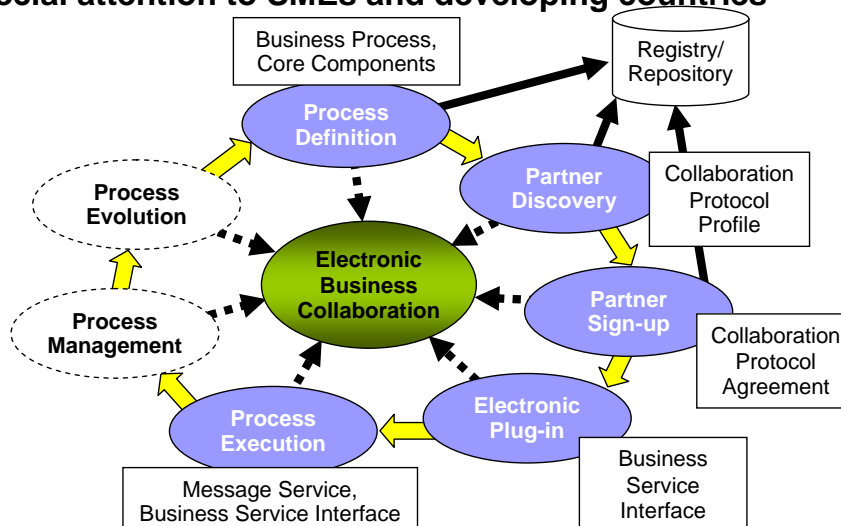

Currently in revision

- **Indeed, many Technical Committees (TCs) are working in synergy with the promoters of the W3C/WSDL-based "stack"**
    - **E.g., UDDI v2 has been developed in the context of ebXML/OASIS, currently WS-BPEL and WS-CAF are being evolved/developed in the context of specific TCs, etc.**
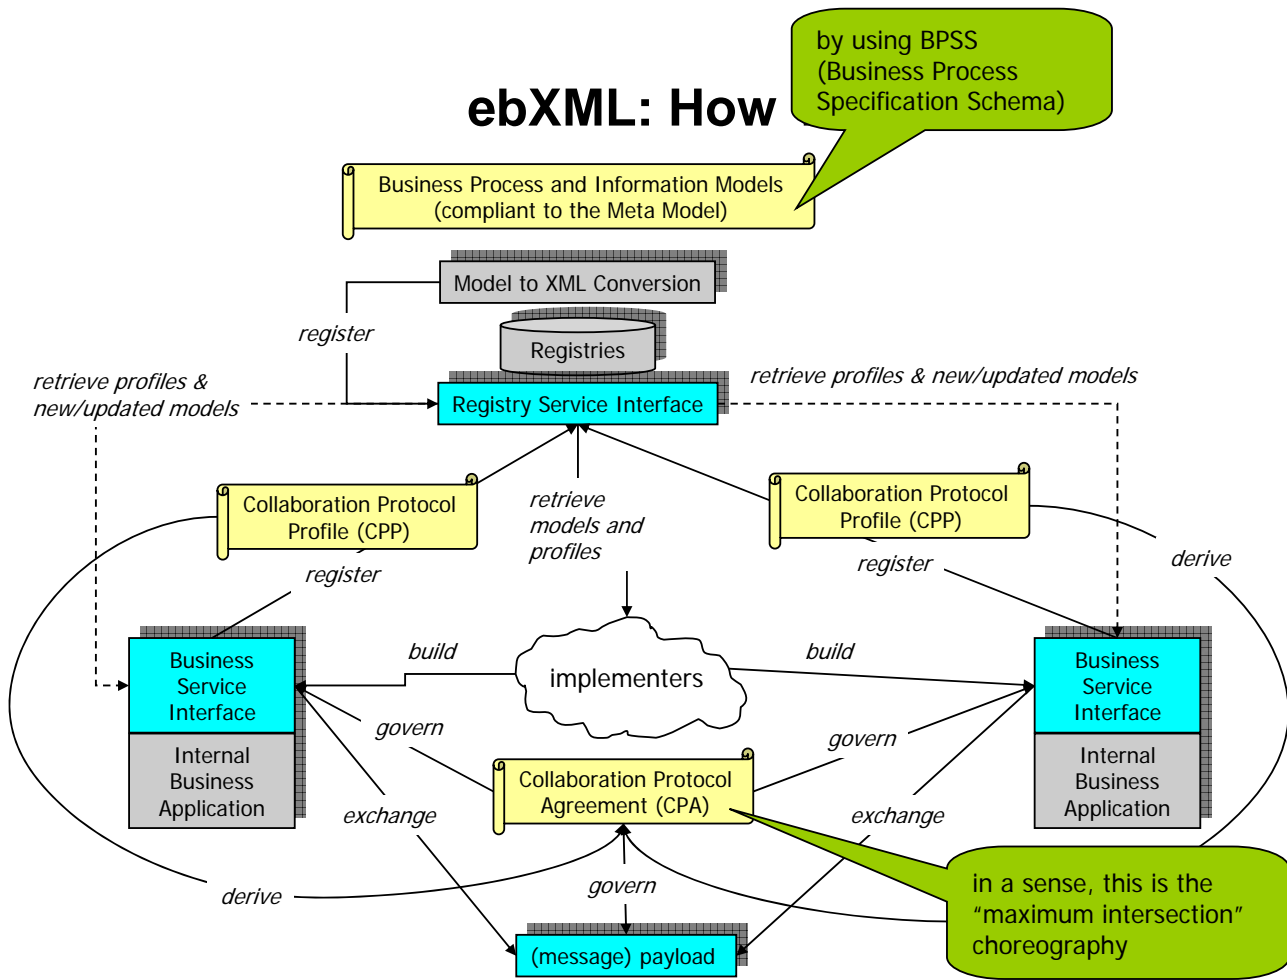

---

ebXML: Aims

To define an open & public infrastructure, based on XML, for distributed electronic commerce

- **Special attention to SMEs and developing <u>countries</u>**

ebXML: How

by using BPSS (Business Process Specification Schema)

Business Process and Information Models (compliant to the Meta Model)

in a sense, this is the "maximum intersection" choreography

(message) payload

---

ebXML: BPSS, CPP e CPA (1)

BPSS is used for modeling a business process, thus obtaining a BPS (Business Process Specification)

- **Partners, roles, *collaborations* and document exchanges (*business transactions*)**

- **Collaboration: set of *activities*; an activity is a business transaction or again a collaboration**

- **Business transaction: a partner is the requester, the other is the responder, in a *business document flow***

CPP: expresses the capabilities of a partner in partecipating in a BPS

ebXML: BPSS, CPP e CPA (2)

A wants to make electronic business with *B*; *A* is the acquirer and *B* the vendor; the process underlying the business is already defined in a BPS
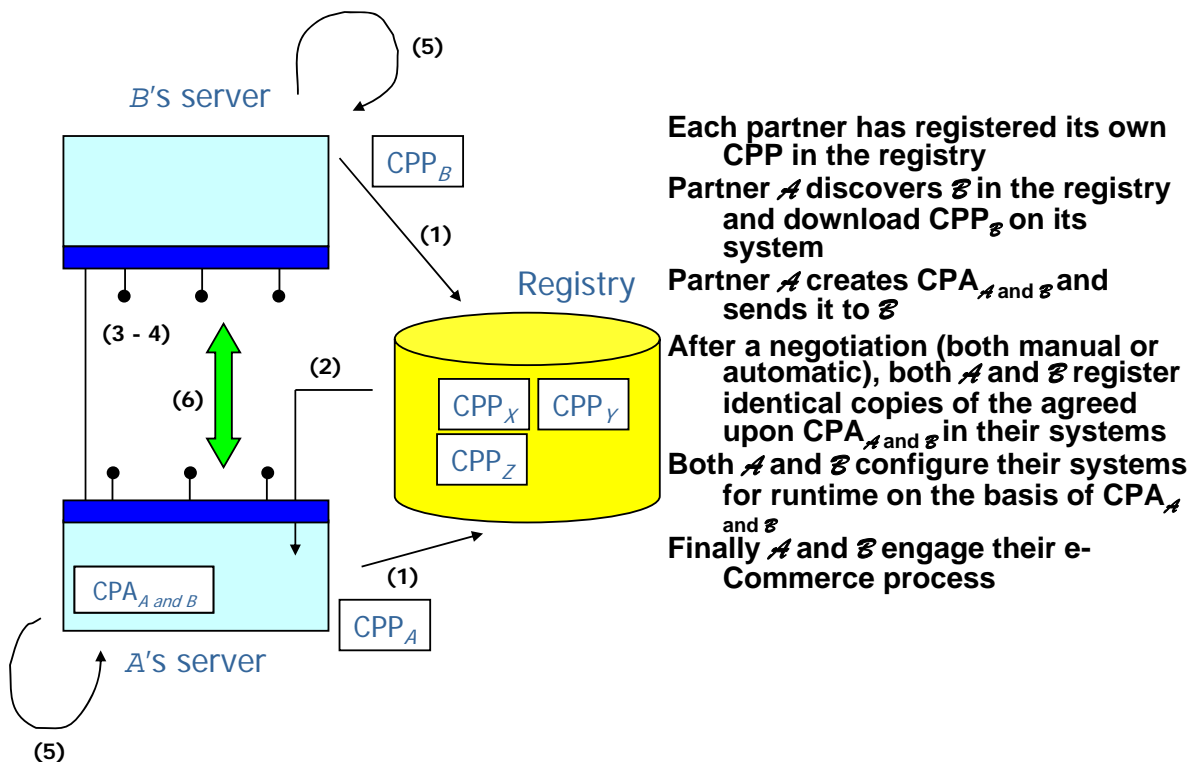

A discovers the *B*'s CPP in a registry

A CPA is created, as the intersection of *A*'s CPP and *B*'s CPP

On the basis of the CPA, the *A*'s and *B*'s business service interfaces are configured in order to support the business transactions

---

ebXML: BPSS, CPP e CPA (3)

(5)

CPP_B

(1)

Registry

(3 - 4)

(2)

(6)

CPP_X CPP_Y

CPP_Z

$CPA_{A \text{ and } B}$

(1)

CPP_A

A's server

(5)

Each partner has registered its own CPP in the registry

Partner *A* discovers *B* in the registry and download CPP_B on its system

Partner *A* creates $CPA_{A \text{ and } B}$ and sends it to *B*

After a negotiation (both manual or automatic), both *A* and *B* register identical copies of the agreed upon $CPA_{A \text{ and } B}$ in their systems

Both *A* and *B* configure their systems for runtime on the basis of $CPA_{A \text{ and } B}$

Finally *A* and *B* engage their e-Commerce process

Semantic Web Services
(approfondimento opzionale)

OWL-S (formely DAML-S)

An emerging standard to add semantics

- **An upper ontology for describing properties &
  capabilities of Web Services using OWL**

**Enable automation of various activities (e.g., service
discovery & selection)**

OWL-S Service Profile
(What it does)

High-level characterization/summary of a service
- **Provider & participants**
- **Capabilities**
- **Functional attributes (e.g., QoS, region served)**

Used for
- **Populating service registries**
  - **A service can have many profiles**
- **Automated service discovery**
- **Service selection (matchmaking)**

One can derive:
- **Service advertisements**
- **Service requests**

OWL-S Service Profile

Capability Description

**Provenance Description**

Functional Attributes

[from DAML-S]

Capability Description

Specification of what the service provides

- **High-level functional representation in terms of:**

  – **preconditions**
  – **inputs**

  – **(conditional) outputs**
  – **(conditional) effects**

IOPE

Inputs

- Set of necessary inputs that the requester should provide to invoke the service

(Conditional) Outputs

- Results that the requester should expect after interaction with the service provider is completed

Preconditions

- Set of conditions that should hold prior to service invocation

(Conditional) Effects

- Set of statements that should hold true if the service is invoked successfully
- Often refer to real-world effects, e.g., a package being delivered, or a credit card being debited

Functional Attributes

Provide supporting information about the service, including:

- **geographical scope**
  - *Pizza Delivery only within the Pittsburgh area*
- **quality descriptions and guarantees**
  - *Stock quotes delivered within 10 secs*
- **service types, service categories**
  - *Commercial / Problem Solving, etc.*
- **service parameters**
  - *Average Response time is currently ...*

141
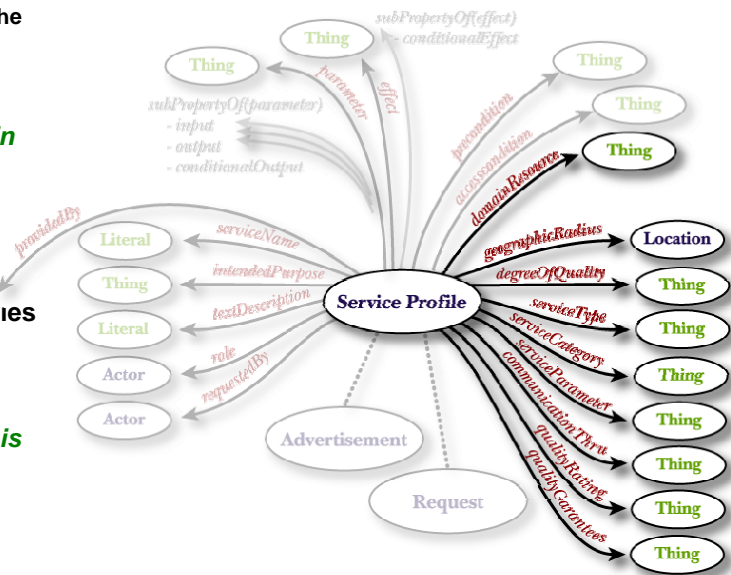

OWL-S Service Model
(How it works)

[from DAML-S]

142
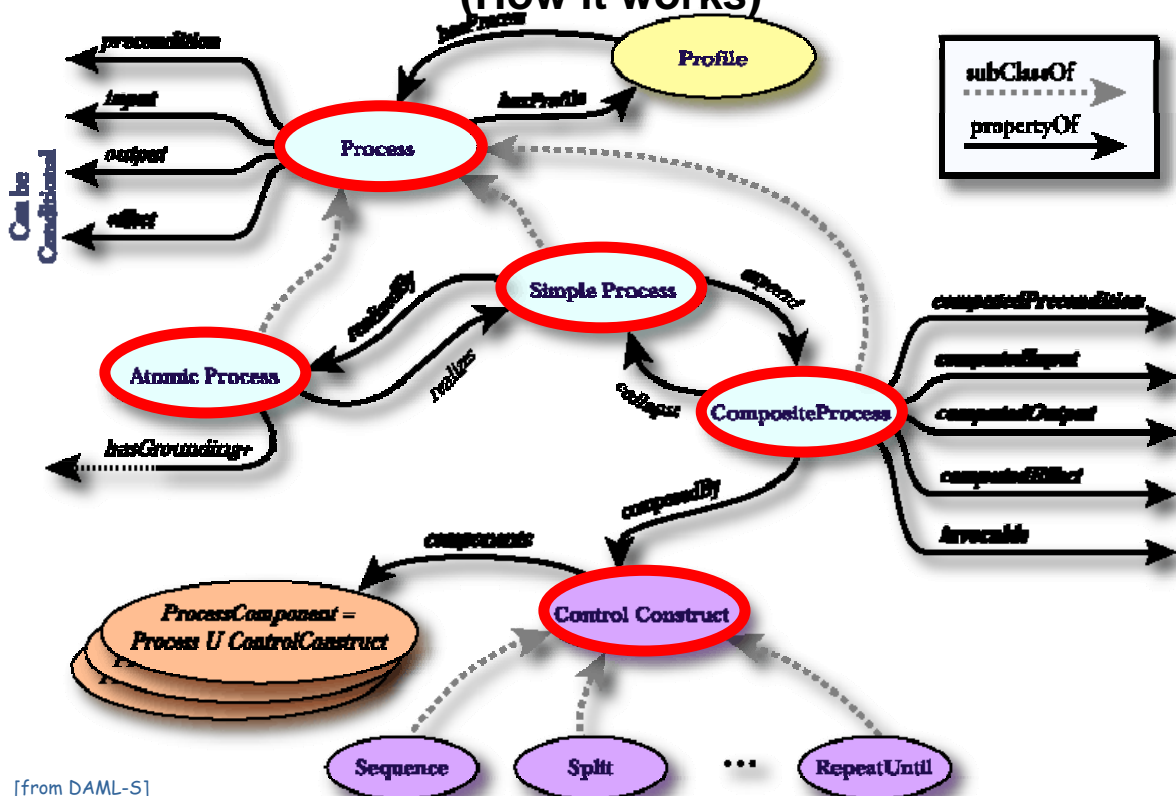

OWL-S Process Ontology

Atomic processes: directly invokable, no subprocesses, executed in a single step

Composite processes: consist of other (non-composite or composite) processes

Simple processes: a virtual view of atomic process or composite process (as a "black box")

Process Model

Constructs for complex processes
- **Sequence**
- **Concurrency: Split; Split+Join; Unordered**
- **Choice**
- **If-Then-Else**
- **Looping: Repeat-Until; Iterate (non-deterministic)**

Data Flow
- **No explicit variables, no internal data store**
- **Predicate "sameValues" to match input of composite service and input of subordinate service**

Less refined than, e.g., WS-BPEL

Enhancements

Recent proposals aim at improving and detailing process modeling and dynamic semantics …

- **WSMO (Web Service Modeling Ontology)**
- **SWSL (Semantic Web Service Language)**

… work in progress !!
